05

PROPOSED SOLUTION

06

CONCLUSION

Introduction

This project analyzes the Order-to-Cash (O2C) process at Home Burger's Lisbon Center, aiming to address inefficiencies and enhance performance in response to the competitive food delivery market. We examine the current workflow (AS-IS), identify issues, and propose improvements (TO-BE) using BPMN modeling, simulations, and data analysis.

The recommendations focus on boosting productivity, adaptability, and service quality while managing costs, ensuring Home Burger can better meet growing demand and maintain its competitive edge.

Background

Home Burger is a leading burger delivery company with six stores across Portugal, handling thousands of orders monthly through phone, website, and in-store channels. The Lisbon Center store, managing the highest order volume, is the focus of this project.

Assumptions:

Estimated salaries, average process times, normal distributions for task variability, and Poisson distribution for incoming customer orders.

FACT BOX:

- ➔ **Founded 2016.**
- ➔ **Stores in Lisbon, Porto, Santarém & Portimão.**
- ➔ **Over 100 employees.**

KEY STAGES:

**1. ORDER
PLACEMENT**

2. PAYMENT

**3. ORDER
PREPARATION**

4. DELIVERY

The Order-to-Cash (O2C) Process

What is the focus of this process?

- Impacts customer experience and satisfaction.
- Delays, errors, and resource constraints affecting delivery speed.

Identified Problems in the Current Process (AS-IS)

1. Lack of automation

- A lot of tasks are done manually causing bottlenecks and waiting times.

2. High Error Rates

- Manual handling of orders increases the risk of mistakes.
- Results in incorrect orders and customer dissatisfaction.

3. Resource Constraints

- Inefficient use of staff during peak hours.
- Causes bottlenecks and longer delivery times.

4. Lack of Integration

- Poor communication between order-taking, preparation, and delivery teams.
- Leads to miscommunication and order delays.

Proposed Solution: (TO-BE)

1. CENTRALIZED ORDER MANAGEMENT SYSTEM

- All orders processed through a unified platform.
- Reduces delays caused by decentralized handling.

2. STREAMLINED COMMUNICATION

- Improved coordination between order-taking, kitchen, and delivery teams.
 - Minimizes miscommunication and errors.
-

3. AUTOMATION

- Automated order entry and status updates.
- Reduces manual errors and increases efficiency.

Calls not answered:

- Automatic followup message is sent to the costumer.

Automated Customer Information:

- System automatically displays costumers' profile with adress and closest store.

Merging new number:

- System merges returning costumer with a different phone number.

1. Orders by Phone

**Proposed solutions for
faster call handling, order
entry, reduced errors and
improved customer
satisfaction.**

2. Orders by Website

Proposed solutions for improved order accuracy, processing speed and enhanced customer experience with immediate confirmations.

AUTOMATED ORDER IMPORTING:

- Orders directly integrated into the system without manual spreadsheet downloads.

ADDRESS VALIDATION AUTOMATION:

- System verifies delivery addresses and sends invite to the correct store automatically.

NO WEBSITE EMPLOYEE:

- There is no need for a website employee as the system is automated.
-

3. In-Store Orders

Orders Registered at the Store have been consistently efficient based on prior simulations and analysis. Hence we concluded that the Order Registered at the Store process does not require any changes in the To-Be model.

In every scenario tested, the process showed no significant bottlenecks, delays, or errors that would necessitate further improvements.

Additionally, the resource allocation was balanced, and the workflow structure supported seamless and accurate order registration.

KITCHEN TASK AUTOMATION:

- Orders appear on kitchen screens automatically.

Proposed solutions for faster preparation, delivery times, improved accuracy and customer satisfaction.

PACKAGER VERIFIES ORDERS:

- Packagers now verify orders so there are no mistakes and returns.

OPTIMIZED DELIVERY ASSIGNMENT:

- Automated route planning for couriers.

DEDICATED COURIER PHONES:

- Couriers will have dedicated phones where they can confirm the delivery.

Order Processing

Benefits of the Redesigned Process

Increased Efficiency

Reduced Errors

Scalability

Improved Customer
Experience

Cost Management

Conclusion

Our proposed solution with centralized order management, streamlined communication, and automation of key steps addresses these issues effectively. Implementing these changes will increase efficiency, reduce errors, improve customer experience, and allow for scalability to meet growing demand.
